Sprint 5 — Product Owner Clarifications

Part II

1. Administrator permissions

Yes. Administrators should be allowed to edit patient and doctor details.

However, receptionists and administrators should have different permission levels.

- Receptionists: Can edit basic patient information, such as name, age, phone number, and address. They can also update permitted doctor information.
- Administrators: Can edit all operational patient and doctor details, manage staff accounts, and manage clinic information.
- Neither role should be able to change sensitive medical information without proper authorization.

2. Medical information (blood type and disease type)

I recommend the following:

- Receptionists: Cannot edit medical information. They should not see it unless access is specifically required for an authorized task.
- Administrators: Can view medical information when necessary but should not routinely edit it.
- Patients: Can view and update their own medical information.

Sensitive Medical Information

By sensitive medical information, I mean private information about a patient's health that should not be accessible to everyone.

In your Clinic Appointment System, examples include:

- Blood type: A+, B+, O-, etc.
- Disease type: Diabetes, heart disease, etc.
- Medical history: Previous illnesses, medical conditions, and treatments.
- Medications: Medicines the patient is currently taking.
- Allergies: Allergies to medicines or other substances.

Why is it sensitive?

Because medical information is private. Not every clinic employee needs to see or change it.

This protects patient privacy and follows role-based access control.

My recommendation for the system

Permission	Receptionist	Administrator
View patient name and phone	Yes	Yes
Edit patient contact details	Yes	Yes
View blood type and disease type	No	Yes
Edit blood type and disease type	No	Yes
View medical history	No	Yes
Edit medical history	No	Yes

3. Appointment cancellation deadline

Recommended: 24 hours

I recommend keeping the 24-hour cancellation rule, rather than changing it to 24 hours.

- Patients can cancel appointments up to 24 hours before the appointment.
- During the final 24 hours, patients cannot cancel themselves.
- Receptionists and administrators can override this restriction when necessary.
- Staff must record a reason for the late cancellation.

This also maintains consistency with our earlier discussion.

4. Additional database fields

I recommend adding both fields in Sprint 5.

Field	Recommendation
Patient home address	Yes
Doctor consultation room	Yes

- Patient home address: Store as an optional field in the patient table.
- Doctor consultation room: Store in the doctor table or as an appropriate clinic/room assignment.

These fields will make patient records and appointment management more complete.

5. Sprint 5 scope

US-18 – Doctor/receptionist account creation

Yes, I recommend including administrator-only account creation if this is part of the acceptance criteria.

- Only administrators can create doctor and receptionist accounts.
- Administrators can assign roles.
- Doctors and receptionists cannot create their own staff accounts.
- Account creation should include login credentials and basic account information.

US-20 – Clinic information management

I recommend including the complete core functionality of US-20, provided it is manageable within the remaining sprint time.

This should cover:

- Viewing clinic information.
- Adding and editing clinic information.
- Managing relevant clinic details, such as address, contact information, and services.

Avoid adding unrelated advanced features.
