Sprint 3 — Product Owner and Development Team Discussion

US-16 — Doctor Appointment Management

Question: What other actions should doctors be allowed to perform? Should they only view appointments or also change appointment details or cancel appointments?

Answer: Doctors can view their scheduled appointments and relevant details, such as patient name, date, and time. They cannot change or cancel appointments directly. These actions are handled by the receptionist/admin.

US-04 — Patient Profile Management

Question: Should patients be allowed to edit all profile fields (full name, age, phone number, blood type, type of disease, and number of close relatives)? Are any fields optional?

Answer: Patients can view and update their profile information. Full name and phone number are required, while age, blood type, type of disease, and number of close relatives are optional.

US-11 — Appointment Confirmation

Question: Should the booking confirmation appear directly on the website, or is email confirmation also required at this stage?

Answer: The confirmation should appear directly on the website after successful booking. It must include the doctor's name, appointment date, time, and appointment reference. Email confirmation is not required at this stage.

US-05 — Doctor Search

Question: If both the doctor name and specialty fields are empty when a patient clicks Search, should the system display all active doctors or ask the patient to enter a search criterion?

Answer: The system should display all active doctors when both fields are empty, allowing patients to browse and select a doctor.

Question: Should the system prevent doctors from creating overlapping availability periods on the same date, or is it acceptable to have overlapping availability as long as the system prevents overlapping confirmed appointments?

Answer: The system should prevent doctors from creating overlapping availability periods on the same date. It should also prevent overlapping confirmed appointments to avoid scheduling conflicts.
