First discussion between developers and Product Owner

1. What are the final user roles? Are we using exactly Patient, Doctor, and Administrator/Receptionist? Should Receptionist and Administrator be one combined role? Is Clinic Management a separate system role or only a stakeholder?

   Final user roles: patient, doctor, receptionist, and administrator.

   The main system users are Patient, Doctor, and Receptionist/Administrator. The receptionist/administrator is responsible for managing clinic operations, including patient and doctor information and appointment records.

   Clinic management is interested in the overall efficiency and organization of the system, but a separate management account, role, permissions, and dashboard are not included in our current scope.

   Therefore, we should proceed with the three defined user roles and their respective permissions, without creating a separate clinic management login or dashboard.

2. Who is allowed to register themselves? Should the public registration page allow only patients to create accounts, or can doctors also register themselves? We assume administrators/receptionists should not be able to create their own admin account through public registration, but we want your confirmation.

   Patient should be allow to register themselves via public registration page. Receptionists and doctors should grant access by administrator. I mean, after hiring doctors and receptionist, the administrator should grant them to have access to their account and create accounts for them base on their role. Then, they will be able to insert/edit their information.

3. If doctors cannot self-register, who creates doctor accounts? Should an Administrator/Receptionist create them later?

   Administrator should have the authority to create doctors and receptionist accounts. Receptionist has the authority to create the doctor and patient account (in some special cases).

4. What information is required during registration in Sprint 1? For example, should we require only Full Name, Email, Password, and Confirm Password, or should we also collect phone number or other information? We want to avoid adding profile information that belongs to later user stories unless you require it now.

   Registration: Full name, age, phone number, email, password, confirm password.
   Profile page: full name, age, phone number, blood type, kind of disease, number of close relative,

5. Should email addresses be unique? We are planning to prevent two accounts from registering with the same email. Please confirm.

   Yes, email address should be unique.

6. What password requirements do you want? For example, should there be a minimum password length or requirements for uppercase letters, numbers, or special characters? The backlog requires secure authentication but does not specify the exact password rule.

   Password should be at least 8 characters including one upper case and one special character.

7. What should happen after successful registration? Should the user see a success message and then go to the Login page, or should the system automatically log them in?

   After successful registration, the user should see a success message and an email should sent and confirm that their account has been successfully created. Then, they should have log them in and have fully access to the doctors list, appointment time…

8. For login, should users log in using Email + Password?

   Yes, correct

9. For US-03 Role-Based Access, what should happen after login? We are planning:
   Patient → Patient Dashboard
   Doctor → Doctor Dashboard
   Administrator/Receptionist → Admin Dashboard Please confirm whether this is correct.
   Yes correct

10. Is any account approval required before a new user can log in? For example, should a patient account work immediately after registration, or does an administrator need to approve it?

    For the first time when creating an account, before creating the account it need the administration approval (for security reasons). Then, when a patient has already an account and wants to log in, no need for approval.
