Second Sprint: Product Owner and Development Team Discussion

1. What doctor information should patients see?

Patients should see the doctor's full name, specialty, qualifications, years of experience, and a short professional biography. Contact information should remain private unless it is necessary for the appointment process.

2. What should patients search doctors by?

Patients should be able to search by doctor name and medical specialty. This will make it easier to find a specific doctor or a doctor who treats their condition.

3. How should doctor availability work?

Doctors should enter their available working time as a range, such as October 18, from 9:00 AM to 1:00 PM. The system should divide this range into appointment slots according to the defined appointment duration and display only available slots to patients.

4. What is the appointment duration?

I recommend 30 minutes per appointment as the initial default. This can be adjusted later if the clinic requires different durations for different services.

5. Can doctors edit or delete availability?

Yes. Doctors should be able to create, update, and delete availability. However, they should not be able to remove a time slot in a way that silently cancels an existing appointment. The system should warn them and require an appropriate resolution.

6. What should happen immediately after US-07 booking?

A simple success message, such as "Appointment booked successfully," is sufficient for US-07. Detailed confirmation information, such as the doctor's name, appointment date, time, and appointment reference, should be handled in US-11.

7. Is a successfully booked appointment immediately confirmed, or does staff approval occur?

I recommend that an appointment be confirmed automatically when the patient successfully books an available slot. Staff approval should not be required unless the clinic specifically requests it. The system must prevent two patients from booking the same slot.

8. Which professional information should be stored now, even though US-14 Doctor Profile Management comes later?

The system should store the basic doctor information required for the earlier user stories: full name, specialty, qualifications, years of experience, professional biography, and availability.

US-14: Doctor Profile Management

As Product Owner, I want US-14 to allow doctors to create, view, edit, and update their professional profiles. The system should store their full name, specialty, qualifications, years of experience, and professional biography in the database. When a doctor updates their information, the system should save the changes and display the updated details to patients when they search for or view that doctor's profile.

Only the doctor who owns the profile or an authorized administrator should be able to modify the information.
